ABSTRACT:

PURPOSE: To attain   voice   and data synthesis, and to improve each kind of
service in communication between   voice   terminals by applying an IVD   -LAN
system.

CONSTITUTION: Voice   communication information from a   voice   terminal 1 is
transmitted through a line processor 5 of a switchboard 4 to a call
processor 6 along with data communication information from a data
terminal 2 by using a terminal adaptor 3. At that time, each kind of
service, for example, processing such as conference telephone service is
performed. The processor 5 is connected through an   LANhigh speed bus 7
controlled by a high speed bus controller (not shown by a figure) with
the other similar processor. The processor 6 imparts a data terminal
control instruction to the processor 5 according to a program for
offering the service. Then, the analysis processing of a CPR order is
performed whether or not the order from the processor 6 is the data
terminal control order is discriminated, a processing corresponding to
the pertinent order is performed when the order is not the data terminal
control order, and it is transferred to the terminal 2.
